

# BREAST CANCER SCREENING (BCS)

## Effectiveness of Care HEDIS® Measure

### Measure definition

Female patients ages 52–74 who had a mammogram to screen for breast cancer between October 2018 and December 2020.<sup>1</sup>

### Exclusions

Patients are excluded if they:

- Have a history of mastectomy on both the left and right side on the same or different dates of service.
- Received hospice care during the measurement year.
- Are age 66 and older with advanced illness and frailty (for additional definition information, see the Advanced Illness and Frailty Guide).

### Information that patient medical records should include

- Date the mammogram was performed.
- Documentation of mastectomy and date performed (if exact date is unknown, the year is acceptable).
- If the patient met exclusion criteria, include the following ICD-10-CM<sup>2</sup> diagnosis codes on the claim, as appropriate:

ICD-10-CM code	Description
Z90.11	Acquired absence of right breast and nipple
Z90.12	Acquired absence of left breast and nipple
Z90.13	Acquired absence of bilateral breasts and nipples

### Tips for success

- Create a standing order to mail to patient for mammography.
- Provide a list of locations where mammogram screenings can be performed.

### Tips for talking with patients

Educate patients about the importance of routine screening:

- Many women with breast cancer do not have symptoms, which is why regular breast cancer screenings are so important.
- Mammograms are an effective method for detecting breast cancer in early stages, when it is most treatable.<sup>3</sup>
- The recommended frequency of routine mammograms is at least once every 24 months for all women ages 50–74. Depending on risk factors, mammograms may be done more frequently.
- The accuracy of mammography improves as women age and has an overall detection rate of about 85 percent.<sup>4</sup>
